CLINICAL IMAGE

CLINICAL COMMENT

A peritoneal simple mesothelial cyst is a very rare mesenteric cyst of mesothelial origin. The size of this lesion usually ranges between a few centimeters and 10 cm. It is usually asymptomatic, but occasionally presents with various, non-specific symptoms, which makes correct pre-operative diagnosis difficult.

These cysts must always be considered in the differential diagnosis of pelvic cystic lesions and other mesenteric cysts. The treatment of choice is the complete surgical excision of the cyst.

Keywords: peritoneal cyst, abdominal tumor, mesothelial cyst.

We took this Image for the abdominal CT scan before surgery (figure 1, A1,2,3)and for a giant peritoneal simple mesothelial cyst intra operatively (figure 2, B1,2,3).
