### CLINICAL IMAGE

a 34-year-old woman, with no notable pathological history, who presents to internal medicine for a recent discovery of seropositivity for HIV, a dermatological opinion was sought for diffuse angiomatous erythematous plaques in the trunk, thighs and back , in front of this aspect a kaposi disease has been suspected, confirmed by histology

During our examination a dermoscopy of the nipple which was clinically normal (Figure 1), was systematically performed

Objectifying an angiomatous aspect, with globules and red-pinkish points (Figures 2, 3), testifying to a nipple localization of his kaposi disease, also confirmed histologically

Note that this aspect has never been reported in the literature to date.
